I think the main difficulties I encountered is prevent html injection and not familiar with jQuery and javascript. So I have to always google what method to use, how to select multiple classes. But I don't think this is a big problem, because for most the case, we can get the information we need. Another difficulty is to convert minutes to hour minutes and convert back. To finish this functionality, I generalized the helper function, which can return an array, if the array contains only one element, its minute format and if the array contains two elements, it is hour, minute format. I think I solve this problem efficiently.

I learned some basic skills about javascript, I think this is good, at least I know when to use it and how to use it and finally when I have some project, I can use it properly.

In this homework, I finished all requirement with good performance. I think I write efficient code and did comment my code clearly.
